

Abstract

A lever device includes an elongated body and a double-sided stretch releasing adhesive attached to the body, whereby the body can be firmly adhesively bonded to a surface and cleanly removed from the surface without damaging the surface by stretching the adhesive. The device may include a base, a body member
5 pivotally connected with the base, and stretch releasing adhesive arranged to attach the base and/or body member to a surface or object. The base may be pivotally connected with an end of the body member or to the middle of the body member.
